

**MEPS HC-011:  
1996 Full Year  
Use and Expenditure Data**

**July 2000**

**Agency for Healthcare Research and Quality  
Center for Cost and Financing Studies  
2101 East Jefferson Street, Suite 500  
Rockville, MD 20852  
(301) 594-1406**

## **User Note**

This file completely replaces the preliminary version of MEPS HC-011, released in December 1999. The expenditure variables have been updated to reflect additional editing. In addition, several variables which were on the preliminary file have been dropped from the final version. MEPS collects data at the “event” (hospitalization, doctor visit, medication purchase) level. Expenses associated with each event are summed to create the person level totals available on this file. Due to differences in rounding, totals from the HC-011 file may not be identical to totals from the event-level files (HC010A - HC010H). See the 1996 Appendix File (HC-010I) for additional information on rounding.

## Table of Contents

## **A. Data Use Agreement**

Individual identifiers have been removed from the microdata contained in the files on this CD-ROM. Nevertheless, under sections 308 (d) and 903 (c) of the Public Health Service Act (42 U.S.C. 242m and 42 U.S.C. 299 a-1), data collected by the Agency for Healthcare Research and Quality (AHRQ) and/or the National Center for Health Statistics (NCHS) may not be used for any purpose other than for the purpose for which they were supplied; any effort to determine the identity of any reported cases, is prohibited by law.

Therefore in accordance with the above referenced Federal statute, it is understood that:

1. No one is to use the data in this data set in any way except for statistical reporting and analysis.
2. If the identity of any person or establishment should be discovered inadvertently, then (a) no use will be made of this knowledge, (b) the Director, Office of Management, AHRQ will be advised of this incident, (c) the information that would identify any individual or establishment will be safeguarded or destroyed, as requested by AHRQ, and (d) no one else will be informed of the discovered identity.
3. No one will attempt to link this data set with individually identifiable records from any data sets other than the Medical Expenditure Panel Survey or the National Health Interview Survey.

By using these data you signify your agreement to comply with the above-stated statutorily based requirements, with the knowledge that deliberately making a false statement in any matter within the jurisdiction of any department or agency of the Federal Government violates 18 U.S.C. 1001 and is punishable by a fine of up to \$10,000 or up to 5 years in prison.

The Agency for Healthcare Research and Quality requests that users cite AHRQ and the Medical Expenditure Panel Survey as the data source in any publications or research based upon these data.

## B. Background

This documentation describes one in a series of public use files from the Medical Expenditure Panel Survey (MEPS). The survey provides a new and extensive data set on the use of health services and health care in the United States.

MEPS is conducted to provide nationally representative estimates of health care use, expenditures, sources of payment, and insurance coverage for the U.S. civilian noninstitutionalized population. MEPS also includes a nationally representative survey of nursing homes and their residents. MEPS is cosponsored by the Agency for Healthcare Research and Quality (AHRQ) (formerly the Agency for Health Care Policy and Research (AHCPR)) and the National Center for Health Statistics (NCHS).

MEPS comprises four component surveys: the Household Component (HC), the Medical Provider Component (MPC), the Insurance Component (IC), and the Nursing Home Component (NHC). The HC is the core survey, and it forms the basis for the MPC sample and part of the IC sample. The separate NHC sample supplements the other MEPS components. Together these surveys yield comprehensive data that provide national estimates of the level and distribution of health care use and expenditures, support health services research, and can be used to assess health care policy implications.

MEPS is the third in a series of national probability surveys conducted by AHRQ on the financing and use of medical care in the United States. The National Medical Care Expenditure Survey (NMCES, also known as NMES-1) was conducted in 1977, the National Medical Expenditure Survey (NMES-2) in 1987. Beginning in 1996, MEPS continues this series with design enhancements and efficiencies that provide a more current data resource to capture the changing dynamics of the health care delivery and insurance system.

The design efficiencies incorporated into MEPS are in accordance with the Department of Health and Human Services (DHHS) Survey Integration Plan of June 1995, which focused on consolidating DHHS surveys, achieving cost efficiencies, reducing respondent burden, and enhancing analytical capacities. To accommodate these goals, new MEPS design features include linkage with the National Health Interview Survey (NHIS), from which the sampling frame for the MEPS HC is drawn, and continuous longitudinal data collection for core survey components. The MEPS HC augments NHIS by selecting a sample of NHIS respondents, collecting additional data on their health care expenditures, and linking these data with additional information collected from the respondents' medical providers, employers, and insurance providers.

### 1.0 Household Component

The MEPS HC, a nationally representative survey of the U.S. civilian noninstitutionalized population, collects medical expenditure data at both the person and household levels. The HC collects detailed data on demographic characteristics, health conditions, health status, use of medical care services,

charges and payments, access to care, satisfaction with care, health insurance coverage, income, and employment.

The HC uses an overlapping panel design in which data are collected through a preliminary contact followed by a series of five rounds of interviews over a 2½-year period. Using computer-assisted personal interviewing (CAPI) technology, data on medical expenditures and use for two calendar years are collected from each household. This series of data collection rounds is launched each subsequent year on a new sample of households to provide overlapping panels of survey data and, when combined with other ongoing panels, will provide continuous and current estimates of health care expenditures.

The sampling frame for the MEPS HC is drawn from respondents to NHIS, conducted by NCHS. NHIS provides a nationally representative sample of the U.S. civilian noninstitutionalized population, with oversampling of Hispanics and blacks.

## **2.0 Medical Provider Component**

The MEPS MPC supplements and validates information on medical care events reported in the MEPS HC by contacting medical providers and pharmacies identified by household respondents. The MPC sample includes all hospitals, hospital physicians, home health agencies, and pharmacies reported in the HC. Also included in the MPC are all office-based physicians:

- Providing care for HC respondents receiving Medicaid.
- Associated with a 75-percent sample of HC households receiving care through an HMO (health maintenance organization) or managed care plan.
- Associated with a 25-percent sample of the remaining HC households.

Data are collected on medical and financial characteristics of medical and pharmacy events reported by HC respondents, including:

- Diagnoses coded according to ICD-9-CM (9th Revision, International Classification of Diseases) and DSM-IV (Fourth Edition, *Diagnostic and Statistical Manual of Mental Disorders*).
- Physician procedure codes classified by CPT-4 (Common Procedure Terminology, Version 4).
- Inpatient stay codes classified by DRGs (diagnosis-related groups).

- Prescriptions coded by national drug code (NDC), medication name, strength, and quantity dispensed.
- Charges, payments, and the reasons for any difference between charges and payments.

The MPC is conducted through telephone interviews and mailed survey materials.

### **3.0 Insurance Component**

The MEPS IC collects data on health insurance plans obtained through employers, unions, and other sources of private health insurance. Data obtained in the IC include the number and types of private insurance plans offered, benefits associated with these plans, premiums, contributions by employers and employees, eligibility requirements, and employer characteristics.

Establishments participating in the MEPS IC are selected through four sampling frames:

- A list of employers or other insurance providers identified by MEPS HC respondents who report having private health insurance at the Round 1 interview.
- A Bureau of the Census list frame of private-sector business establishments.
- The Census of Governments from Bureau of the Census.
- An Internal Revenue Service list of the self-employed.

To provide an integrated picture of health insurance, data collected from the first sampling frame (employers and insurance providers) are linked back to data provided by the MEPS HC respondents. Data from the other three sampling frames are collected to provide annual national and State estimates of the supply of private health insurance available to American workers and to evaluate policy issues pertaining to health insurance.

The MEPS IC is an annual survey. Data are collected from the selected organizations through a prescreening telephone interview, a mailed questionnaire, and a telephone followup for nonrespondents.

### **4.0 Nursing Home Component**

The 1996 MEPS NHC was a survey of nursing homes and persons residing in or admitted to nursing homes at any time during calendar year 1996. The NHC gathered information on the demographic characteristics, residence history, health and functional status, use of services, use of prescription medicines, and health care expenditures of nursing home residents. Nursing home administrators and

designated staff also provided information on facility size, ownership, certification status, services provided, revenues and expenses, and other facility characteristics. Data on the income, assets, family relationships, and care-giving services for sampled nursing home residents were obtained from next-of-kin or other knowledgeable persons in the community.

The 1996 MEPS NHC sample was selected using a two-stage stratified probability design. In the first stage, facilities were selected; in the second stage, facility residents were sampled, selecting both persons in residence on January 1, 1996, and those admitted during the period January 1 through December 31.

The sample frame for facilities was derived from the National Health Provider Inventory, which is updated periodically by NCHS. The MEPS NHC data were collected in person in three rounds of data collection over a 1½-year period using the CAPI system. Community data were collected by telephone using computer-assisted telephone interviewing (CATI) technology. At the end of three rounds of data collection, the sample consisted of approximately 815 responding facilities, 3,209 residents in the facility on January 1, and 2,690 eligible residents admitted during 1996.

## **5.0 Survey Management**

MEPS data are collected under the authority of the Public Health Service Act. They are edited and published in accordance with the confidentiality provisions of this act and the Privacy Act. NCHS provides consultation and technical assistance.

As soon as data collection and editing are completed, the MEPS survey data are released to the public in staged releases of summary reports and microdata files. Summary reports are released as printed documents and electronic files. Microdata files are released on CD-ROM and/or as electronic files.

Printed documents and CD-ROMs are available through the AHRQ Publications Clearinghouse. Write or call:

AHRQ Publications Clearinghouse  
Attn: (publication number)  
P.O. Box 8547  
Silver Spring, MD 20907  
800/358-9295  
410/381-3150 (callers outside the United States only)  
888/586-6340 (toll-free TDD service; hearing impaired only)

Be sure to specify the AHRQ number of the document or CD-ROM you are requesting. Selected electronic files are available from the Internet on the MEPS web site: <<http://www.meps.ahrq.gov/>>.

Additional information on MEPS is available from the MEPS project manager or the MEPS public use data manager at the Center for Cost and Financing Studies, Agency for Healthcare Research and Quality, 2101 East Jefferson Street, Suite 500, Rockville, MD 20852 (301/594-1406).

## **C. Technical and Programming Information**

### **1.0 General Information**

This documentation describes the 1996 full-year income and expenditures data file from the Medical Expenditure Panel Survey Household Component (MEPS HC). Released as an ASCII data file and SAS transport file, this public use file provides information collected on a nationally representative sample of the civilian noninstitutionalized population of the United States and can be used to make estimates of utilization and expenditures for calendar year 1996. This file consists of data obtained in Rounds 1, 2 and 3 of the survey (i.e., covering calendar year 1996) and contains variables pertaining to income, use and health care expenditures.

The following documentation offers a brief overview of the types and levels of data provided, the content and structure of the files and the codebook, and programming information. It contains the following sections:

- Data File Information
- Survey Sample Information
- Programming Information
- Codebook (Section D)

For more information on MEPS HC survey design see S. Cohen, 1997; J. Cohen, 1997; and S. Cohen, 1996. For information on the MEPS MPC design, see S. Cohen, 1998. A copy of the survey instrument used to collect the information on this file is available on the MEPS web site at the following address: <<http://www.meps.ahrq.gov>>.

### **2.0 Data File Description**

This public use data set contains one record for each of 22,601 persons from the Household Component of the 1996 Panel of the Medical Panel Expenditure Survey. This count includes all household survey respondents who resided in eligible responding households. Of these persons, a total of 21,571 were assigned a positive person level weight. For each variable on the file, both weighted and unweighted frequencies are provided in the codebook. In conjunction with the weight variable (WTDPER96) provided on this file, data for these persons can be used to make estimates for the civilian non-institutionalized U.S. population for 1996.

Data from this file can be merged with previously released 1996 MEPS HC person data using the unique person identifier, DUPERSID, to append person characteristics such as demographic or health insurance characteristics to each record.

## **2.1 Codebook Structure**

For each variable on the file, both weighted and unweighted frequencies are provided. The codebook and data file sequence list variables in the following order:

- Unique person identifiers
- Income variables
- Expenditure variables
- Weight and variance estimation variables

## **2.2 Reserved Codes**

The following reserved code values are used:

<b>VALUE</b>	<b>DEFINITION</b>
-1 INAPPLICABLE	Question was not asked due to skip pattern.
-3 NO DATA IN ROUND	Person has no data in round.
-7 REFUSED	Question was asked and respondent refused to answer question.
-8 DK	Question was asked and respondent did not know answer.
-9 NOT ASCERTAINED	Interviewer did not record the data.

## **2.3 Codebook Format**

This codebook describes an ASCII data set and provides the following information for each variable:

<b>IDENTIFIER</b>	<b>DESCRIPTION</b>
Name	Variable name (maximum of 8 characters)
Description	Variable descriptor (maximum of 40 characters)
Format	Number of bytes
Type	Type of data: numeric (indicated by NUM) or character (indicated by CHAR)
Start	Beginning column position of variable in record
End	Ending column position of variable in record

## **2.4 Variable Naming**

In general, variable names reflect the content of the variable, with an 8 character limitation. Variables contained on this file were derived either from the questionnaire itself or from the CAPI. Additional details on naming conventions for utilization and expenditure variables can be found in Appendix 1.

## **3.0 Data File Contents**

### **3.1 ID Variables**

The definitions of Dwelling Units (DUs) and Group Quarters in the MEPS Household Component are generally consistent with the definitions employed for the National Health Interview Survey. The dwelling unit ID (DUID) is a five-digit random ID number assigned after the case was sampled for MEPS. The person number (PID) uniquely identifies all persons within the dwelling unit. The variable DUPERSID is the combination of the variables DUID and PID.

### **3.2 Income and Tax Filing Variables**

The file provides income and tax-related variables that were constructed primarily from data collected in the Round 3 Income Section. Person-level income amounts have been edited and imputed for every record on the full-year file, with detailed imputation flags provided as a guide to the method of editing. The tax-filing variables and some program participation variables are unedited as discussed below.

Logical editing or weighted, sequential hot-deck imputation was used to impute income amounts for missing values (both for item non-response and for persons in the full-year file who were not in Round 3). Reported income components were generally left unedited (with the few exceptions noted below). Thus, analysts using these data may wish to apply additional checks for outlier values that would appear to stem from misreporting.

The editing process began with wage and salary income, WAGEPNX. Complete responses were left unedited, and the associated imputation flag was set to WAGEIMP=1. The only exception was for a small number of persons who reported zero wage and salary income despite having been employed for pay during the year according to round level data (see below). Since data on tax filing and on taxable income sources were collected using an approach that encouraged respondents to provide information from their federal tax returns, logical edits were used to assign separate income amounts to married persons whose responses were based on combined income amounts on their joint tax returns.

The second group (WAGEIMP=2) consisted of persons who provided broad income ranges rather than giving specific dollar amounts. We used weighted sequential hot-decking to provide these individuals with specific dollar amounts. For this imputation, donors were persons who gave specific

dollar amounts within the corresponding broad income ranges. All WAGEPNX hot-deck imputations used cells defined on the basis of a conventional list of person-level characteristics including age, education, employment status, race, sex, and region.

The third group (WAGEIMP=3) were persons who did not report wage and salary income and who were assigned WAGEPNX=0 based on either being under 16 or not having been employed during the year.

The fourth group (WAGEIMP=4) consisted of persons who did not provide valid dollar amounts or dollar ranges, but for whom we had information from the employment sections of Rounds 1, 2, and 3 concerning wages, hours, and weeks worked (in all jobs). We used these data to construct annualized wage amounts that we used in place of missing annual wage and salary data. Comparisons of reported and constructed wages and salaries using persons who provided both sorts of information made us highly confident that employment data could be reliably used to fill in missing wage and salary information (the two measures were highly correlated and the means differed by less than \$20). To implement this approach, part-year responders were assumed to be fully-employed during the remainder of the year if they were employed during the period in which they provided data – the exception being those who left due to death or institutionalization. These persons were assigned zero wages and salaries for the time they were not in MEPS.

Remaining persons with missing WAGEPNX were hot-decked amounts from donor pools that included persons whose WAGEPNX amounts were edited in the steps described above. Whenever possible, the hot-deck imputations used data on whether or not the person had been employed at any point during the year (and, if available, the number of weeks worked). Persons deemed to have been employed were hot-decked in conditional imputations that used only donors with positive WAGEPNX amounts (WAGEIMP=5). Remaining persons were hot-decked WAGEPNX in an unconditional imputation that used both workers and nonworkers as donors (WAGEIMP=6).

Having edited WAGEPNX for all persons in the full-year file, we then edited the remaining income sources in the following sequence: INTRPNX, BUSNPNX, FARMPNX, DIVDPNX, REFDPNX, ALIMPNX, SALEPNX, TRSTPNX, PENSPNX, IRASPNX, SSECPNX, UNEMPNX, WCMPPNX, VETSPNX, CASHPNX, OTHRPNX, CHLDPNX, SSIPNX, and PUBPNX. Income components were edited sequentially, in each case using information regarding income amounts that had already been edited (so as to maintain patterns of correlation across income sources whenever possible). In all cases, bracketed responses were edited first (using hot-deck imputations from donors in corresponding brackets who gave specific dollar amounts), followed by hot-decking for remaining missing values. The hot-deck imputations used cells defined on the basis of income amounts already edited and a conventional list of person-level characteristics such as age, education, employment status, race, sex, and region. In addition, hot-deck imputations for CHLDPNX used family-level information concerning marital status and the number of children. SSIPNX and PUBPNX were also hotdecked in part using simulated program eligibility indicators that integrated state-level program eligibility criteria with data on family composition and income.

Reported income amounts less than 1 dollar were treated as missing amounts (to be hotdecked from donors with positive amounts of the corresponding income source). Also, a very few cases of outlier responses were edited (primarily public sources of income that exceeded possible amounts). With only one other exception, reported income amounts were left unchanged. The exception is Social Security Income, SSECPNX, which was under-reported in the MEPS by approximately 25 percent relative to the March 1997 Current Population Survey (CPS). Comparison with the CPS identified the source of the MEPS under reporting to be persons aged 65 and older who failed to report any SSECPNX despite having also reported no earned income. Persons over 65 with neither earnings nor Social Security income are quite rare in the CPS, giving us confidence in editing these responses. Using the CPS, a probabilistic model was developed to select persons/couples whose values of SSECPNX were changed from zero to a positive (imputed) amount.

For all of the income components, *xxIMP* variables contain indicators concerning the method for editing/imputation. All the flag variables have the following formatted values: 1=Original response used; 2=Bracket converted; 3=Missing value set to 0; 4=Weeks worked/earnings used (WAGEIMP only); 5=Conditional hotdeck; 6=Unconditional hotdeck. Missing values were set to zero when there were too few recipients to warrant hotdecking positive values (as in the case of ALIMPNX received by males or WAGEPNX received by persons under age 16). Conditional hotdecks refer to cases where the respondent indicated receipt but not a specific dollar amount. In these cases, the donor pool was restricted to persons with nonzero amounts of the income source in question. Unconditional hotdecks expanded the donor pool to include persons receiving both zero and nonzero amounts (implemented in cases where we had little or no information about whether the person received the income source or not).

Total person-level income (TTLPNX) is the sum of all income components with the exception of REFDPNX and SALEPNX (so that we are following as closely as possible the CPS definition of income). Some researchers may wish to define their own income measure by adding in one or both of these excluded components.

The tax variables, foodstamp variables, SSI disability flag, and AFDC participation flag are all completely unedited. In particular, while the tax variables are provided to assist researchers building tax simulation programs, they contain substantial item nonresponse, and no effort was made to eliminate inconsistencies with other MEPS data. All of these unedited variables should be used with great care.

### **3.2.1 Income Top-Coding**

All income amounts on the file, including both total income and the separate sources of income, were top coded to preserve confidentiality. For each income source, top codes were applied to the top percentile of all cases (including negative amounts that exceeded income thresholds in absolute value). In cases where fewer than one percent of all persons received a particular income source, we top-coded all recipients. Top-coded income amounts were masked using a regression-based approach.

The regressions relied on many of the same variables used in the hot-deck imputations, with the dependent variable in each case being the natural logarithm of the amount that the income component was in excess of its top-code threshold. Predicted values from this regression were reconverted from logarithms to levels using a smearing correction, and these predicted amounts were then added back to the top-code thresholds. This approach preserves the component-by-component weighted means (both overall and among top-coded cases), while also preserving much of the income distribution conditional on the variables contained in our regressions. At the same time, this approach ensures that every reported amount in excess of its respective threshold is altered on the public use file. The process of top-coding income amounts in this way inevitably introduces measurement error in cases where income amounts were reported correctly by respondents. Note, however, that top-coding can also help to reduce the impact of outliers that occur due to misreporting.

Total income is constructed as the sum of the adjusted income components. Having constructed total income in this manner, we then top-coded this total using the same regression-based procedure described above (again masking the top percentile of cases). Finally, we scaled the components of income up or down in order to make the sources of income consistent with the newly-adjusted totals.

### **3.3 Utilization, Expenditures, and Expenditures by Sources of Payment**

The MEPS Household Component (HC) collects data in each round on use and expenditures for office and hospital-based care, home health care, dental services, vision aids, and prescribed medicines. Data were collected for each sample person at the event level (e.g. doctor visit, hospital stay) and summed across rounds 1-3 (excluding 1997 events covered in round 3) to produce the annual utilization and expenditure data for 1996 in this file. In addition, the MEPS Medical Provider Component (MPC) is a follow-back survey that collected data from a sample of medical providers and pharmacies that were used by sample persons in 1996. Expenditure data collected in the MPC are generally regarded as more accurate than information collected in the HC and were used to improve the overall quality of MEPS expenditure data in this file (see sections 3.3.1-3.3.1.6 for description of methodology used to develop expenditure data).

This file contains utilization and expenditure variables for several categories of health care services. The utilization variables in this release supercede those released in MEPS public use file HC-003. In general, there is one utilization variable (based on HC responses only), 13 expenditure variables (derived from both HC and MPC responses), and 1 charge variable for each category of health care service. The utilization variable is typically a count of the number of medical events reported for the category. The 13 expenditure variables consist of an aggregate total payments variable, 10 main component source of payment category variables, and 2 additional source of payment category variables (see section 3.3.1.5 for description of source of payment categories). Expenditure variables for all categories of health care combined are also provided.

The attached table in Appendix 1 provides an overview of the utilization and expenditure variables included in this file. For each health service category, the table lists the corresponding utilization variable(s) and provides a general key to the expenditure variable names (13 per service category). The first 3 characters of the expenditure variable names reflect the service category (except only 2 characters for prescription medicines) while the subsequent 3 characters (\*\*\*) in table) reflect the naming convention for the source of payment categories described in section 3.3.1.5 below (except only 2 characters for Veterans Administration). The last 2 positions of all utilization and expenditure variable names reflect the survey year (i.e. 96). More details are provided on the utilization and expenditure variables in sections 3.3.1 and 3.3.2 below.

### **3.3.1 Expenditures Definition**

Expenditures on this file refer to what is paid for health care services. More specifically, expenditures in MEPS are defined as the sum of direct payments for care provided during the year, including out-of-pocket payments and payments by private insurance, Medicaid, Medicare, and other sources. Payments for over the counter drugs and for alternative care services are not included in MEPS total expenditures. Indirect payments not related to specific medical events, such as Medicaid Disproportionate Share and Medicare Direct Medical Education subsidies, are also not included.

The definition of expenditures used in MEPS is somewhat different from the 1987 NMES and 1977 NMCES surveys where “charges” rather than “sum of payments” were used to measure expenditures. This change was adopted because charges became a less appropriate proxy for medical expenditures during the 1990’s due to the increasingly common practice of discounting charges. Another change from the two prior surveys is that charges associated with uncollected liability, bad debt, and charitable care (unless provided by a public clinic or hospital) are not counted as expenditures because there are no payments associated with those classifications.

While the concept of expenditures in MEPS has been operationalized as payments for health care services, variables reflecting charges for services received are also provided on the file (see section 3.3.1.6). Analysts should use caution when working with the charge variables because they do not typically represent actual dollars exchanged for services or the resource costs of those services.

#### **3.3.1.1 Data Sources on Expenditures**

The expenditure data included on this file were derived from the MEPS Household and Medical Provider Components. Only HC data were collected for nonphysician visits, dental and vision services, other medical equipment and services, and home health care not provided by an agency while data on expenditures for care provided by home health agencies were only collected in the MPC. In addition to HC data, MPC data were collected for some office-based visits to physicians (or medical providers supervised by physicians), hospital-based events (e.g. inpatient stays, emergency room visits, and outpatient department visits), and prescribed medicines (see section 3.3.2.7). For these types of events, MPC data were used if complete; otherwise HC data were used if complete. Missing data for

events where HC data were not complete and MPC data were not collected or complete were derived through an imputation process (see section 3.3.1.2).

A series of logical edits were applied to both the HC and MPC data to correct for several problems including outliers, copayments or charges reported as total payments, and reimbursed amounts that were reported as out of pocket payments. In addition, edits were implemented to correct for misclassifications between Medicare and Medicaid and between Medicare HMO's and private HMO's as payment sources. Data were not edited to insure complete consistency between the health insurance and source of payment variables on the file.

### **3.3.1.2 Imputation for Missing Expenditures and Data Adjustments**

Expenditure data were imputed to 1) replace missing data, 2) provide estimates for care delivered under capitated reimbursement arrangements, and 3) to adjust household reported insurance payments because respondents were often unaware that their insurer paid a discounted amount to the provider. This section contains a general description of the approaches used for these three situations. A more detailed description of the editing and imputation procedures will be provided in the documentation for the forthcoming MEPS event level files.

Missing data on expenditures were imputed using a weighted sequential hot-deck procedure for most medical visits and services. In general, this procedure imputes data from events with complete information to events with missing information but similar characteristics. For each event type, selected predictor variables with known values (e.g., total charge, demographic characteristics, region, provider type, and characteristics of the event of care, such as whether it involved surgery) were used to form groups of donor events with known data on expenditures, as well as identical groups of recipient events with missing data. Within such groups, data were assigned from donors to recipients, taking into account the weights associated with the MEPS complex survey design. Only MPC data were used as donors for hospital-based events while data from both the HC and MPC were used as donors for office-based physician visits. The general approach that was used to impute missing expenditure data on prescribed medicines is described in section 3.3.2.7 below.

Because payments for medical care provided under capitated reimbursement arrangements and through public clinics and Veterans' Hospitals are not tied to particular medical events, expenditures for events covered under those types of arrangements and settings were also imputed. Events covered under capitated arrangements were imputed from events covered under managed care arrangements that were paid based on a discounted fee-for-service method, while imputations for visits to public clinics and Veterans' Hospitals were based on similar events that were paid on a fee-for-service basis. As for other events, selected predictor variables were used to form groups of donor and recipient events for the imputations.

An adjustment was also applied to some HC reported expenditure data because an evaluation of matched HC/MPC data showed that respondents who reported that charges and payments were equal

were often unaware that insurance payments for the care had been based on a discounted charge. To compensate for this systematic reporting error, a weighted sequential hot-deck imputation procedure was implemented to determine an adjustment factor for HC reported insurance payments when charges and payments were reported to be equal. As for the other imputations, selected predictor variables were used to form groups of donor and recipient events for the imputation process.

### **3.3.1.3 Methodology for Flat Fee Expenditures**

Most of the expenditures for medical care reported by MEPS participants are associated with single medical events. However, in some situations there is one charge that covers multiple contacts between a medical provider and patient (e.g. obstetrician services, orthodontia). In these situations (generally called flat or global fees), total payments for the flat or global fee were included if the initial service was provided in 1996. For example, all payments for an orthodontist's fee that covered multiple visits over three years were included if the initial visit occurred in 1996. However, if a visit in 1996 to an orthodontist was part of a flat fee in which the initial visit occurred in 1995, then none of the payments for the flat fee were included.

The approach used to count expenditures for flat fees may create what appear to be inconsistencies between utilization and expenditure variables. For example, if several visits under a flat fee arrangement occurred in 1996 but the first visit occurred in 1995, then none of the expenditures were included, resulting in low expenditures relative to utilization for that person. Conversely, the flat fee methodology may result in high expenditures for some persons relative to their utilization. For example, all of the expenditures for an expensive flat fee were included even if only the first visit covered by the fee had occurred in 1996. On average, the methodology used for flat fees should result in a balance between overestimation and underestimation of expenditures in a particular year.

### **3.3.1.4 Zero Expenditures**

There are some medical events reported by respondents where the payments were zero. This could occur for several reasons including (1) free care/free sample of medicine was provided, (2) bad debt was incurred, (3) care was covered under a flat fee arrangement beginning in an earlier year, or (4) follow-up visits were provided without a separate charge (e.g. after a surgical procedure). In summary, these types of events have no impact on the person level expenditure variables contained in this file.

### **3.3.1.5 Source of Payment Categories**

In addition to total expenditures, variables are provided which itemize expenditures according to the major source of payment categories. These categories are:

1. Out of pocket by user or family (SLF);
2. Medicare (MCR);
3. Medicaid (MCD);
4. Private Insurance (PRV);
5. Veteran's Administration, excluding CHAMPVA (VA);
6. CHAMPUS (i.e. TRICARE) or CHAMPVA (CHM);
7. Other Federal Sources--includes Indian Health Service, Military Treatment Facilities, and other care provided by the Federal government (OFD);
8. Other State and Local Source--includes community and neighborhood clinics, State and local health departments, and State programs other than Medicaid (STL);
9. Worker's Compensation (WCP);
10. Other Unclassified Sources--includes sources such as automobile, homeowner's, liability, and other miscellaneous or unknown sources (OSR).

Two additional source of payment variables were created to classify payments for particular persons that appear inconsistent due to differences between the survey questions on health insurance coverage and sources of payment for medical events. These variables include:

11. Other Private (OPR)—any type of private insurance payments reported for persons not reported to have any private health insurance coverage during the year as defined in MEPS (i.e. for hospital and physician services); and
12. Other Public (OPU)—Medicaid payments reported for persons who were not reported to be enrolled in the Medicaid program at any time during the year.

Though relatively small in magnitude, users should exercise caution when interpreting the expenditures associated with the OPR and OPU categories. While these payments stem from apparent inconsistent responses to the health insurance and source of payment questions in the survey, some of these inconsistencies may have logical explanations. For example, private insurance coverage in MEPS is defined as having a major medical plan covering hospital and physician services. If a MEPS sample person did not have such coverage but had a single service type insurance plan (e.g. dental insurance) that paid for a particular episode of care, those payments may be classified as "other private". Some of the "other public" payments may stem from confusion between Medicaid and other state and local programs or may be for persons who were not enrolled in Medicaid, but were presumed eligible by a provider who ultimately received payments from the program.

The naming conventions used for the source of payment expenditure variables are shown in parentheses in the list of categories above and in the key to the attached table. In addition, total expenditure variables (EXP in key) based on the sum of the 12 source of payment variables above are provided.

### **3.3.1.6 Charge Variables**

In addition to the expenditure variables described above, a variable reflecting total charges is provided for each type of service category (except prescribed medicines). This variable represents the sum of all fully established charges for care received and usually does not reflect actual payments made for services, which can be substantially lower due to factors such as negotiated discounts, bad debt, and free care (see above). The naming convention used for the charge variables (TCH) is also included in the key to the attached table.

### **3.3.2 Utilization and Expenditure Variables by Type of Medical Service**

The following sections summarize definitional, conceptual and analytic considerations when using the utilization and expenditure variables in this file. Separate discussions are provided for each MEPS medical service category.

#### **3.3.2.1 Medical Provider Visits (i.e., Office-Based Visits)**

Medical provider visits consist of encounters that took place primarily in office-based settings and clinics. Care provided in other settings such as a hospital, nursing home, or a person's home are not included in this category.

The total number of office based visits reported for 1996 (OBTOTV96) as well as the number of such visits to physicians (OBDRV96) and nonphysician providers (OBOTHV96) are contained in this file. For a small proportion of sample persons, the sum of the physician and nonphysician visit variables (OBDRV96+OBOTHV96) is less than the total number of office-based visits variable (OBTOTV96) because OBTOTV96 contains reported visits where the respondent did not know the type of provider.

Non-physician visits (OBOTHV96) include visits to the following types of providers: chiropractors, midwives, nurses and nurse practitioners, optometrists, podiatrists, physician's assistants, physical therapists, occupational therapists, psychologists, social workers, technicians, receptionists/clerks/secretaries, or other medical providers. Separate utilization variables are included for selected types of more commonly seen non-physician providers including chiropractors (OBCHIR96), nurses/nurse practitioners (OBNURS96), optometrists (OBOPTO96), physician assistants (OBASST96), and physical or occupational therapists (OBTHER96).

Expenditure variables associated with all medical provider visits, physician visits, and non-physician visits in office-based settings can be identified using the attached table. As for the corresponding utilization variables, the sum of the physician and non-physician visit expenditure variables (e.g. OBDEXP96+OBOEXP96) is less than the total office-based expenditure variable (OBVEXP96) for a small proportion of sample persons. This can occur because OBVEXP96 includes visits where the respondent did not know the type of provider seen.

### **3.3.2.2 Hospital Events**

Separate utilization variables for hospital care are provided for each type of setting (inpatient, outpatient department, and emergency room) along with two expense variables per setting; one for basic hospital facility expenses and another for payments to physicians who billed separately for services provided at the hospital. These payments are referred to as “separately billing doctor” or SBD expenses.

Hospital facility expenses include all expenses for direct hospital care, including room and board, diagnostic and laboratory work, x-rays, and similar charges, as well as any physician services included in the hospital charge. Separately billing doctor (SBD) expenses typically cover services provided to patients in hospital settings by providers like radiologists, anesthesiologists, and pathologists, whose charges are often not included in hospital bills.

### **Hospital Outpatient Visits**

Variables for the total number of reported visits to hospital outpatient departments in 1996 (OPTOTV96) as well as the number of outpatient department visits to physicians (OPDRV96) and non-physician providers (OPOTHV96) are contained in this file. For a small proportion of sample persons, the sum of the physician and non-physician visit variables (OPDRV96+OPOTHV96) is less than the total number of outpatient visits variable (OPTOTV96) because OPTOTV96 contains reported visits where the respondent did not provide information on the type of provider seen.

Expenditure variables (both facility and SBD) associated with all medical provider visits, physician visits, and non-physician visits in outpatient departments can be identified using the attached table. As for the corresponding utilization variables, the sum of the physician and non-physician expenditure variables (e.g. OPVEXP96+OPOEXP96 for facility expenses) is less than the variable for total outpatient department expenditures (OPFEXP96) for a small proportion of sample persons. This can occur because OBFEXP96 includes visits where the respondent did not know the type of provider seen. No expenditure variables are provided for health care consultations that occurred over the telephone.

### **Hospital Emergency Room Visits**

The variable ERTOT96 represents a count of all emergency room visits reported for the survey year. Expenditure variables associated with ERTOT96 are identified in the attached table. It should be noted that hospitals usually include expenses associated with emergency room visits that immediately result in an inpatient stay with the charges and payments for the inpatient stay. Therefore, to avoid the potential for double counting when imputing missing expenses, separately reported expenditures for emergency room visits that were identified in the MPC as directly linked to an inpatient stay were included as part of the inpatient stay only (see below). This strategy to avoid double counting resulted in \$0 expenditures for these emergency room visits. However, these \$0 emergency room visits are still

counted as separate visits in the utilization variable ERTOT96.

### **Hospital Inpatient Stays**

Two measures of total inpatient utilization are provided on the file: (1) total number of hospital discharges (IPDIS96) and (2) the total number of nights associated with these discharges (IPNGTD96). IPDIS96 includes hospital stays where the dates of admission and discharge were reported as identical. These “zero night stays” can be included or excluded from inpatient analyses at the user’s discretion (see last paragraph of this section). If the number of nights in the hospital could not be computed for any reported stay for a person, then IPNGTD96 was assigned a missing value.

Expenditure variables associated with hospital inpatient stays are identified in the attached table. To the extent possible, payments associated with emergency room visits that immediately preceded an inpatient stay are included with the inpatient expenditures (see above) and payments associated with healthy newborns are included with expenditures for the mother (see next paragraph for more detail).

Data used to construct the inpatient utilization and expenditure variables for newborns were edited to exclude stays where the newborn left the hospital on the same day as the mother. This edit was applied because discharges for infants without complications after birth were not consistently reported in the survey and charges for newborns without complications are typically included in the mother’s hospital bill. However, if the newborn was discharged at a later date than the mother was discharged, then the discharge was considered a separate stay for the newborn when constructing the utilization and expenditure variables.

Some analysts may prefer to exclude zero night stays from inpatient analyses and/or count these stays as ambulatory visits. Therefore, a separate use variable is provided which contains a count of the number of inpatient events where the reported dates of admission and discharge were the same (IPZERO96). This variable can be subtracted from IPDIS96 to exclude “zero night” stays from inpatient utilization estimates. In addition, separate expenditure variables are provided for “zero night” facility expenses (ZIFEXP96) and for separately billing doctor expenses (ZIDEXP96). Analysts who choose to exclude zero-night stays from inpatient expenditure analyses need to subtract the zero-night expenditure variable from the corresponding expenditure variable for total inpatient stays (e.g. IPFEXP96-ZIFEXP96 for facility expenses, IPDEXP96-ZIDEXP96 for separately billing doctor expenses).

#### **3.3.2.3 Dental Visits**

The total number of dental visits variable (DVTOT96) includes those to any person(s) for dental care including general dentists, dental hygienists, dental technicians, dental surgeons, orthodontists, endodontists, and periodontists. Additional variables are provided for the numbers of dental visits to general dentists (DVGEN96) and to orthodontists (DVORTH96). For a small proportion of sample

persons, the sum of the general dentist and orthodontist visit variables (DVGEN96+DVORTH96) is greater than the total number of dental visits (DVTOT96). This result can only occur for persons who were reported to have seen both a general dentist and orthodontist in the same visit(s). When this occurred, expenditures for the visit were included as orthodontist expenses but not as general dentist expenses. Expenditure variables for all three categories of dental providers can be identified using the attached table.

### **3.3.2.4 Home Health Care**

In contrast to other types of medical events where data were collected on a per visit basis, information on home health care utilization is collected in MEPS on a per month basis. Variables are provided which indicate the total number of months in 1996 where home health care was received from any type of paid or unpaid caregiver (HHTOTM96), agencies, hospitals, or nursing homes (HHAGM96), self-employed persons (HHINDM96), and unpaid informal caregivers not living with the sample person (HHINFM96).

In addition to monthly utilization variables, variables are also provided for the number of “provider days” of care received. The number of provider days represents the sum across months of the number of days on which home health care was received, with days summed across all providers seen. For example, if a person received care in one month from one provider on 2 different days, then the number of provider days would equal 2. The number of provider days would also equal 2 if a person received care from 2 different providers on the same day. However, if a person received care from 1 provider 2 times in the same day, then the provider days would equal 1. As for the month variables described above, separate variables for provider days are included for each source of care category (HHTOTD96, HHAGD96, HHINDD96, and HHINFD96). These variables were assigned missing values if the number of provider days could not be computed for any month in which the specific type of home health care was received.

Separate expenditure variables are provided for agency-sponsored home health care (includes care provided by home health agencies, hospitals, and nursing homes) and care provided by self-employed persons. The attached table identifies the home health care utilization and expenditure variables contained in the file.

### **3.3.2.5 Vision Aids**

Expenditure variables for the purchase of glasses and/or contact lenses are identified in the attached table. Due to the data collection methodology, it was not possible to determine whether vision items that were reported in round 3 had been purchased in 1996 or 1997. Therefore, expenses reported in round 3 were only included if more than half of the person’s reference period for the round was in 1996.

### **3.3.2.6 Other Medical Equipment and Services**

This category includes expenditures for ambulance services, orthopedic items, hearing devices, prostheses, bathroom aids, medical equipment, disposable supplies, alterations/modifications, and other miscellaneous items or services that were obtained, purchased or rented during the year. Respondents were only asked once (in round 3) about their total annual expenditures and were not asked about their frequency of use of these services. Expenditure variables representing the combined expenses for these supplies and services are identified in the Appendix 1 table.

### **3.3.2.7 Prescribed Medicines**

There is one total utilization variable (RXTOT96), one free sample utilization variable (RXFREE96), and 13 expenditure variables included on the 1996 full-year file relating to prescribed medicines. These 13 expenditure variables include an annual total expenditure variable (RXEXP96) and 12 corresponding annual source of payment variables (RXSLF96, RXMCR96, RXMCD96, RXPRV96, RXVA96, RXCHM96, RXOFD96, RXSTL96, RXWCP96, RXOSR96, RXOPR96, and RXOPU96). Unlike the other event types, the prescribed medicine events have some remaining inconsistencies in the data when comparing information from the insurance section of the Household Component and source of payment information from the Pharmacy Component (more specifically, discrepancies between Medicare only household insurance responses and Medicaid source of payment provided by pharmacy providers). These inconsistencies remain unedited because there was strong evidence from the Pharmacy Component that these were indeed Medicaid payments. All of these types of Household Component events were either exact matches to events in the Pharmacy Component or refills of exact matches, and in addition, all of these types of events were purchases by persons with positive weights. The total utilization variable is a count of all prescribed medications initially purchased or otherwise obtained during 1996, as well as any additional acquisitions of the medication. Free samples are also included in the total utilization variable. The free sample utilization variable can be subtracted from the total utilization variable to create a use variable that represents the number of purchases of prescribed medicines. The total expenditure variable sums all amounts paid out-of-pocket and by third party payers for each prescription purchased in 1996. No variables reflecting charges for prescription medicines are included because a large proportion of respondents to the pharmacy component survey did not provide charge data (see below).

#### **Prescribed Medicines Data Collected**

Data regarding prescription drugs were obtained through the household questionnaire and a pharmacy component survey. During each round of the MEPS HC, all respondents were asked to supply the name of any prescribed medication they or their family members purchased or otherwise obtained during that round. For each medication and in each round, the following information was collected: whether any free samples of the medication were obtained; the name(s) of any health problems the medication was prescribed for; the number of times the prescription drug was obtained or purchased;

the year, month, and day on which the person first used the medication; and a list of the names, addresses, and types of pharmacies that filled the household's prescriptions. Also, during the Household Component, respondents were asked if they send in claim forms for their prescriptions (self-filers) or if their pharmacy providers do this automatically for them at the point of purchase (non-self-filers). For non-self-filers, charge and payment information was collected in the pharmacy component survey. However, charge and payment information was collected for self-filers in the household questionnaire, because payments by private third party payers for self-filers' purchases would not be available from a pharmacy follow-back survey.

Pharmacy providers identified by the household were contacted by mail for the pharmacy component survey if permission was obtained in writing from the person with the prescription to release their pharmacy records. The signed permission forms were provided to the various establishments prior to making any requests for information. Each establishment was informed of all persons participating in the survey that had prescriptions filled there in 1996 and a computerized printout containing information about these prescriptions was sought. For each medication listed, the following information was requested: date filled; National Drug Code (NDC); medication name; strength of medicine (amount and unit); quantity (package size and amount dispensed); total charge; and payments by source.

When diabetic supplies, such as syringes and insulin, were reported in the other medical supply section of the MEPS HC questionnaire as having been obtained during the round, the interviewer was directed to collect information on these items in the prescription drug section of MEPS. Data on expenses for these items were collected in and imputed from the pharmacy component survey.

### **Prescribed Medicines Data Editing and Imputation**

The general approach to preparing the household prescription data for this file was to utilize the pharmacy component prescription data to assign expenditure values to the household drug mentions. For self-filers, information on payment sources was retained to the extent that these data were reported by the household in the charge and payment section of the household questionnaire. A matching program was adopted to link pharmacy survey drugs and the corresponding drug information to household drug mentions. To improve the quality of these matches, all drugs on the household and pharmacy files were coded based on the medication names provided by the household and pharmacy, and when available, the National Drug Code (NDC) provided in the pharmacy survey. Considerable editing was done prior to the matching to identify free samples among household drug mentions, correct data inconsistencies in both data sets, and fill in missing data and correct outliers on the pharmacy file.

Drug price per unit outliers were analyzed on the pharmacy file by first identifying the average wholesale unit price (AWUP) of the drug by linkage through the NDC to a proprietary data base. In general, prescription drug unit prices were deemed to be outliers by comparing unit prices reported in the pharmacy data base to the AWUP and were edited, as necessary.

Round 3 household drug mentions in MEPS were not identified in the HC as 1996 or 1997 drug events for persons in households in which their Round 3 began in 1996 and ended in 1997. All exact matches to pharmacy survey drug events for persons whose pharmacies participated were classified as 1996 drug purchases. Any remaining Round 3 household drug mentions for persons with Round 3 spanning both years were randomly allocated to 1996 or 1997 based on the proportion of the household's Round 3 period in each year.

## **4.0 Sample Weights and Variance Estimation Variables (WTDPER96-VARPSU96)**

### **Overview**

There is a single full year person-level weight (WTDPER96) included on this file. A person-level weight was assigned to each prescribed medicine reported by a key, in-scope person who responded to MEPS for the full period of time that he or she was in scope during 1996. A key person either was a member of an NHIS household at the time of the NHIS interview, or became a member of such a household after being out-of-scope at the time of the 1995 NHIS (examples of the latter situation include newborns and persons returning from military service, an institution, or living outside the United States). A person is in scope whenever he or she is a member of the civilian noninstitutionalized portion of the U.S. population.

### **4.1 Details on Person Weights Construction**

The person-level weight WTDPER96 was developed using the MEPS Round 1 person-level weight as a base weight (for key, in scope respondents who joined an RU after Round 1, the Round 1 RU weight served as a base weight). The weighting process included an adjustment for nonresponse over Round 2 and the 1996 portion of Round 3, as well as poststratification to population control figures for December 1996 (these figures were derived by scaling the population totals obtained from the March 1997 Current Population Survey (CPS) to reflect the Census Bureau estimated population distribution across age and sex categories as of December, 1996). Variables used in the establishment of person-level poststratification control figures included: poverty status (below poverty, from 100 to 125 percent of poverty, from 125 to 200 percent of poverty, from 200 to 400 percent of poverty, at least 400 percent of poverty); census region (Northeast, Midwest, South, West); MSA status (MSA, non-MSA); race/ethnicity (Hispanic, black but non-Hispanic, and other); sex; and age. Overall, the weighted population estimate for the civilian non-institutionalized population for December 31, 1996 is 265,439,511 persons. The inclusion of key, in scope persons who were not in scope on December 31, 1996 brings the estimated total number of persons represented by the MEPS respondents over the course of the year up to 268,905,490 ( $WTDPER96 > 0$ ). The weighting process included poststratification to population totals obtained from the 1996 Medicare Current Beneficiary Survey (MCBS) for the number of deaths among Medicare beneficiaries in 1996, and poststratification to population totals obtained from the 1996 MEPS Nursing Home Component for the number of individuals admitted to nursing homes.

The MEPS Round 1 weights incorporated the following components: the original household probability of selection for the NHIS; ratio-adjustment to NHIS national population estimates at the household (occupied dwelling unit) level; adjustment for nonresponse at the dwelling unit level for Round 1; and poststratification to figures at the family- and person-level obtained from the March 1996 CPS database.

## **4.2 Variance Estimation**

To obtain estimates of variability (such as the standard error of sample estimates or corresponding confidence intervals) for estimates based on MEPS survey data, one needs to take into account the complex sample design of MEPS. Various approaches can be used to develop such estimates of variance including use of the Taylor series or various replication methodologies. Replicate weights have not been developed for the MEPS 1996 data. Variables needed to implement a Taylor series estimation approach is described in the paragraph below.

Using a Taylor Series approach, variance estimation strata and the variance estimation PSUs within these strata must be specified. The corresponding variables on the MEPS full year utilization database are VARSTR96 and VARPSU96, respectively. Specifying a “with replacement” design in a computer software package such as SUDAAN (Shah, 1996) should provide standard errors appropriate for assessing the variability of MEPS survey estimates. It should be noted that the number of degrees of freedom associated with estimates of variability indicated by such a package may not appropriately reflect the actual number available. For MEPS sample estimates for characteristics generally distributed throughout the country (and thus the sample PSUs), there are over 100 degrees of freedom associated with the corresponding estimates of variance.

## **5.0 Programming Information**

The following are the technical specifications for the HC-011 data file, which is provided in ASCII and SAS formats.

### **ASCII version:**

File Name: HC011.DAT

Number of Records: 22,601

Number of Variables: 509

Record Length: 1947

Record Format: fixed

Record Identifier and Sort Key: DUPERSID

### **SAS Transport version:**

File Name: HC011.SSP

SAS Name: HC011

Number of Observations: 22,601

Number of Variables: 509

Record Identifier and Sort Key: DUPERSID

## **D. Codebook**
